

Our Approach

QRUIT is an AI recruitment agent that runs your hiring pipeline end to end - reading job descriptions and CVs from wherever you keep them today, screening candidates, running a first-round interview, and reporting back with a ranked recommendation, fully automated once a role is set up. Here is exactly how we'll get there, step by step.

1

Kickoff & access setup

Someone with admin rights on your Google Workspace or Microsoft 365 grants QRUIT read access to the mailbox and folders you already use for hiring. It's a roughly 20-minute process, done entirely through Google's or Microsoft's own login screen - we never see or store a password.

2

Start WhatsApp verification in parallel

If you want candidates reachable over WhatsApp, this is the step to start on day one: a verified Meta Business account and pre-approved message templates. It's outside our control and can take a few days, so it runs alongside everything else rather than after it.

Start this the same day as Step 1 - it's the longest lead time in the whole plan.

3

Prove it safe before it's real

Every part of the pipeline is tested against deliberately hostile conditions - a dropped connection, a corrupted file, a provider going down - in an isolated environment, before it ever touches your real inbox or a real candidate.

4

Run one real role end to end

With access connected, we take a single live role through the full pipeline on your real data - job description in, candidates screened, interview run, report out - so you see exactly how it behaves before it's handling everything at once.

5

Bring WhatsApp online

Once Meta's verification clears, WhatsApp goes live alongside email, so candidates can reply however suits them - a CV forwarded by email or sent straight over WhatsApp is picked up the same way.

6

Full hands-off rollout

QRUIT runs across all your hiring roles from here - automated day to day, freeing your team to focus on the hiring decisions rather than the process. A manual checkpoint can be switched on for any specific role or step, if you'd ever like extra oversight on a sensitive hire.

What we need from you, and when

- Step 1: an admin contact for your Google Workspace or Microsoft 365, and confirmation of which mailbox/folders to connect.
- Step 2: a phone number for WhatsApp Business, and sign-off on the wording for a handful of message templates.
- A short, separate checklist covers all of this in full detail - nothing on it requires sharing a password with us.

Bottom line: each step earns the next. We don't move forward until the previous one is proven, so by the time QRUIT is handling your real hiring, it's already been tested against everything we could think to break.
